

TEST RESULTS

Ms. Miller was administered the PAI, MMPI-2 and SCL-90-R.

PAI results

The PAI is a 344-item self report inventory used to assist in clinical diagnosis and screening for psychopathology. It includes both validity and clinical scales, as well as treatment and interpersonal scales. Ms. Miller's validity profile appears to be valid and she appears to have

answered questions in a reasonably forthright manner. She did not attempt to present an unrealistic or inaccurate impression of herself, either more positive or negative than warranted.

Her clinical scales reveal no elevations, suggesting a lack of clinical psychopathology. Her pattern of scores indicate turmoil in her life that may cause some stress for her, but not to the point where prominent symptoms are observed. She may feel unhappy or tense at times, but her self-esteem appears intact and her scores suggest the stress is having little impact on her ability to function. This interpretation is supported by her self report and the observations of this evaluator during her interview.

Her self report on the PAI is consistent with her self report in the interview. She denies currently having significant problems in the following areas: unusual thoughts or peculiar experiences; extreme moodiness or impulsivity; unhappiness or depression; undue suspiciousness or hostility; marked anxiety; problematic behaviors used to manage anxiety; unusually elevated mood or heightened activity.

Her profile further suggests that Ms. Miller approaches life with a clear sense of purpose and with distinct convictions, with a well-articulated sense of who she is and what her goals are. Her current situation is reflected in her profile, which suggests that while she is going through a stressful time in her life, she appears to have a number of supportive relationships that appear to serve as a buffer against the effects of this stress.

MMPI-2 results

The MMPI-2 is the most widely used and well researched test of adult psychopathology. It is
